March, 2024

VIVEKANANDA COLLEGE OF ENGINEERING & TECHNOLOGY
[A Unit of Vivekananda VidyavardhakaSangha Puttur (R)]
Affiliated to Visvesvaraya Technological University and Approved by AICTE New Delhi & Govt. of Karnataka
Nehru Nagar, Puttur - 574203, DK, Karnataka, India

DEPARTMENT OF COMPUTER SCIENCE & ENGINEERING

CERTIFICATE

Certified that the mini-project work entitled **"Stationery Management System"** is carried out by **SAMEEKSHA, SATHVIKA JAIN** bearing USNs **4VP21CS078, 4VP21CS083** respectively bonafide students of **Vivekananda College of Engineering & Technology, Puttur** in partial fulfilment for the award of **Bachelor of Engineering** in **Computer Science and Engineering** of the **Visvesvaraya Technological University, Belagavi** during the year 2023-24. It is certified that all corrections/suggestions indicated during Internal Assessment have been incorporated in the report deposited in the departmental library.

The mini-project report has been approved as it satisfies the academic requirements in respect of mini-Project work prescribed for the said Degree.

Signature of the Guide **Prof. Thapaswini P S**	**Signature of the Guide** **Prof. Krishna Mohana A J**	**Signature of the HOD** **Dr. Nischaykumar Hegde**

EXTERNAL VIVA

Name of the Examiners	Signature with date
1…….....	.....
2…….....	.....

ACKNOWLEDGEMENT

We take this opportunity to express our deep heartfelt gratitude to all those people who have helped us in the successful completion of the mini-project.

First and foremost, we would like to express our sincere gratitude to our guides, **Prof. Krishna Mohana A J and Prof. Thapaswini P S,** Assistant Professor, CS & E Department, VCET for providing excellent guidance, encouragement and inspiration throughout the mini-project work. Without their invaluable guidance, this work would never have been a successful one.

We would like to express our sincere gratitude to our Head of the Department of Computer Science & Engineering, **Dr. Nischaykumar Hegde** for his guidance and inspiration.

We would like to thank our Principal, **Dr. Mahesh Prasanna K** for providing all the facilities and a proper environment to work in the college campus.

We are thankful to all the teaching and non-teaching staff members of Computer Science & Engineering Department for their help and needed support rendered throughout the mini-project.

DECLARATION

We, **SAMEEKSHA (4VP21CS078), SATHVIKA JAIN (4VP21CS083)** students of fifth semester B. E. in Computer Science and Engineering, **Vivekananda College of Engineering & Technology, Puttur,** hereby declare that the mini-project work entitled **"STATIONERY MANAGEMENT SYSTEM"** has been carried out and duly executed by us at VCET, Puttur, under the guidance of **Prof. Thapaswini P S** and **Prof. Krishna Mohana A J** Assistant Professors, Department of Computer Science & Engineering, Vivekananda College of Engineering & Technology, Puttur, and submitted in partial fulfillment of the requirements for the award of degree in **Bachelor of Engineering in Computer Science & Engineering**, by **Visvesvaraya Technological University**, Belagavi during the academic year 2023-2024.

SAMEEKSHA	**4VP21CS078**
SATHVIKA JAIN	**4VP21CS083**

Date:

Place: VCET.

ABSTRACT

The "Stationery Management System" presents a sophisticated online shopping platform tailored to the efficient procurement of stationery supplies. With a focus on enhancing user experience and optimizing inventory management, the system provides a seamless interface for customers to browse, select, and purchase stationery products. Key objectives encompass the design of a user-friendly shopping process, the implementation of a secure registration and login system, comprehensive product listings with detailed descriptions, efficient order management, and transparent order history tracking. The system's primary output includes a dynamic dashboard for users to explore an extensive array of stationery items and place orders effortlessly. Features encompass inventory management, order processing, and detailed transaction history for both customers and administrators. By seamlessly connecting suppliers and consumers, the system facilitates streamlined procurement processes, ensuring that businesses and individuals can acquire essential stationery supplies conveniently and reliably.

Chapter 1

INTRODUCTION

1.1 **Introduction Stationery Management System**

In the contemporary digital landscape, the "Stationery Management System" emerges as a revolutionary platform, fundamentally reshaping the shopping journey for writing and creative enthusiasts. Unlike conventional retail experiences, this innovative system transcends traditional boundaries, honing in on an eclectic range of products including Pens, Pencils, Notebooks, Desk Organizers, and Art Supplies.

At its core, the platform stands as a testament to the seamless fusion of technology and stationery, ushering in a new era of discovery, purchase, and organization for users worldwide. Through intuitive interfaces and cutting-edge features, it empowers individuals to navigate through an extensive array of creative tools with unparalleled ease and convenience.

The ethos of simplicity and user satisfaction lies at the heart of the "Stationery Management System." From its sleek design to its responsive functionality, every aspect of the platform is meticulously crafted to enhance the user experience. With meticulous inventory management ensuring the availability of sought-after items and personalized recommendations catering to individual preferences, the system aims to exceed user expectations at every turn.

More than just a marketplace, the platform aspires to become the ultimate centralized hub for all stationery needs. Whether users are seeking inspiration for their next artistic endeavor or searching for the perfect tools to organize their workspace, the system offers a comprehensive solution tailored to their unique requirements.

Ultimately, the "Stationery Management System" invites users to explore a space where the art of writing intersects with online convenience, enriching the modern lifestyle with boundless creativity and inspiration. It represents a transformative force in the realm of stationery, fostering a vibrant community of like-minded individuals united by their shared passion for self-expression and creativity.

1.2 Introduction to Database Management System

A database management system (DBMS) refers to the technology for creating and managing databases. DBMS is a software tool to organize (create, retrieve, update, and manage) data in a database. A software for storing and retrieving user by considering appropriate security measures. It allows users to create their own databases as per their requirement.

It consists of group of programs which manipulate the database and provide an interface between the databases. It includes the user of the database and other application programs. The DBMS accepts the request for data from an application and instructs the operating system to provide the specific data. In large systems, a DBMS helps users and other third-party software to store and retrieve data.

If it is any field that has contributed to the greatest advancements in the world today, it is the field of information technology, commonly known by the acronym IT. When most people hear of the phrase 'Information Technology', they tend to picture several Tecno-geeks seated by the computer and fixing some computer software.

Types of DBMS

There are mainly 4 types of DBMS, which are Hierarchical, Relational, Network, and Object-Oriented DBMS.

- **Hierarchical DBMS:** As the name suggests, this type of DBMS has a style of predecessor-successor type of relationship. So, it has a structure similar to that of a tree, wherein the nodes represent records and the branches of the tree represent fields.
- **Relational DBMS (RDBMS):** This type of DBMS, uses a structure that allows the users to identify and access data in relation to another piece of data in the database.
- **Network DBMS:** This type of DBMS supports many to many relations wherein multiple member records can be linked.
- **Object-Oriented DBMS:** This type of DBMS uses small individual software called objects. Each object contains a piece of data, and the instructions for the actions to be done with the data.

1.3 Applications of DBMS

1. **Railway Reservation System:** In the railway reservation system, the database is required to store the record or data of ticket bookings, status about train's arrival, and departure. Also, if trains get late, people get to know it through database update.

2. **Library Management System:** There are lots of books in the library so; it is tough to store the record of all the books in a register or copy. So, the database management system (DBMS) is used to maintain all the information related to the name of the book, issue date, availability of the book, and its author.

3. **Banking:** Database management system is used to store the transaction information of the customer in the database.

4. **Education Sector:** Presently, examinations are conducted online by many colleges and universities. They manage all examination data through the database management system (DBMS). In spite that student's registrations details, grades, courses, fee, attendance, results, etc. all the information is stored in the database.

5. **Credit Card Transactions:** Database Management system is used for purchasing on credit cards and generation of monthly statements.

6. **Social Media Sites:** We all use of social media websites to connect with friends and to share our views with the world. Daily, millions of peoples sign up for these social media accounts like Pinterest, Facebook, Twitter, and Google plus. By the use of the database management system, all the information of users is stored in the database and, we become able to connect with other people.

7. **Telecommunication:** Without DBMS any telecommunication company can't think. The Database management system is necessary for these companies to store the call details and monthly postpaid bills in the database.

8. **Finance:** The database management system is used for storing information about sales, holding and purchases of financial instruments such as stocks and bonds in a database.

9. **Online Shopping:** Everyone wants to shop through online shopping websites (such as Amazon, Flipkart, snap deal) from home. So, all the products are sold and added only

with the help of the database management system (DBMS). Invoice bills, payments, purchase information all of these are done with the help of DBMS.

10. **Human Resource Management:** Big firms or companies have many workers or employees working under them. They store information about employee's salary, tax, and work with the help of database management system (DBMS).

11. **Manufacturing:** Manufacturing companies make different types of products and sale them on a daily basis. In order to keep the information about their products like bills, purchase of the product, quantity, supply chain management, database management system (DBMS) is used.

12. **Airline Management System:** This system is the same as the railway reservation system. This system also uses a database management system to store the records of flights departure, arrival, and delay status.

1.4 Introduction to XAMPP

XAMPP, an acronym for Cross-Platform (X), Apache (A), MySQL (M), PHP (P), and Perl (P), is a robust and versatile web development solution. Developed to simplify the process of setting up a local web server environment, XAMPP empowers developers to create, manage, and deploy dynamic websites and web applications effortlessly.

Apache, the leading open-source web server software, forms the backbone of XAMPP, providing a reliable platform for hosting web content. MySQL, a renowned Relational Database Management System (RDBMS), complements Apache, serving as a fast and efficient storage and retrieval solution for large volumes of data.

XAMPP is further enhanced with PHP, a powerful server-side scripting language, and Perl, a versatile programming language, enabling developers to build interactive and dynamic web applications with ease.

Developed, marketed, and supported by MySQL AB, a Swedish company, XAMPP embodies the spirit of open-source software, offering developers access to a rich ecosystem of tools and resources. Written primarily in the C and C++ programming languages, XAMPP is compatible with various operating systems, including Windows, Linux, and MacOS.

With its multi-layered design and kernel thread support, XAMPP ensures high performance, capable of utilizing multiple CPUs if present. Whether deployed in client/server setups or embedded systems, XAMPP provides unmatched flexibility and scalability, earning it global acclaim among developers.

Chapter 2

ANALYSIS AND REQUIREMENT SPECIFICATION

2.1 Purpose of This Project

The purpose of the "Online Stationery Shopping Website" project is to establish a comprehensive and user-friendly platform that optimizes the purchasing of stationery items for users.

- Streamline the stationery shopping process by offering an intuitive and accessible platform for both administrators and users.
- Simplify stationery selection and ordering through a user-friendly interface, enhancing the overall shopping experience.
- Improve the inventory tracking and order fulfillment process for administrators by providing tools to manage stock levels, reorder points, and purchase requests effectively.
- Ensure a secure and seamless registration and login system for both administrators and customers, guaranteeing authorized access to the online stationery shopping system.
- Enable customers to browse and purchase stationery items through a well-organized catalog with filtering options based on categories, brands, and quantities.
- Provide a customer dashboard for users to manage their orders, track order history, and update account information.
- Implement secure payment gateways and encryption to safeguard customer information during online transactions.

2.2 Scope of the Project

The scope of the "Stationery Shopping Platform" project involves creating a comprehensive web application tailored to address the specific requirements of both administrators and user for efficient stationery inventory management and online purchasing.

- Develop a user-friendly registration and login system for both administrators and user to ensure secure and authorized access to the stationery shopping platform.

- Enable shoppers to browse, select, and purchase stationery items through an intuitive and visually appealing catalog with advanced filtering options based on categories, brands, and quantities.
- Implement a stationery order management system, allowing user to submit orders, and administrators to efficiently review, process, and manage them.
- Design detailed product pages for each stationery item, providing comprehensive information, pricing details, and high-quality images to assist user in making informed purchase decisions.
- Create an administrative dashboard for administrators, enabling them to monitor stationery inventory levels, track sales patterns, and manage purchase orders efficiently.
- Utilize modern technologies, such as PHP for enhanced server-side scripting, XAMPP as the development environment, JavaScript for frontend and backend development, and CSS for styling to deliver a seamless and responsive shopping experience.
- Ensure the scalability and maintainability of the web application architecture to accommodate the evolving needs of the organization and potential increases in stationery inventory and customer transactions.
- Provide a secure environment for user data and stationery shopping processes, implementing encryption, secure payment gateways, and access control measures to safeguard sensitive information and ensure secure online transactions.

2.3 Functional Requirements

The "Stationery Management System" requires a user-friendly interface for stationery browsing and purchasing, coupled with effective management of listings by suppliers. Users should register, login, and seamlessly browse stationery items with filtering options. Ordering processes must be intuitive, and a purchase history feature is crucial. Implementing modern technologies like PHP and CSS is essential for scalability and enhanced user experience.

2.3.1 Modules: There are two modules in functional requirements

User Module: This module facilitates user interaction, enabling registration, login, and smooth browsing and purchasing of stationery items.

Description: Ensures seamless user interaction.

Features: User registration, login, password encryption, session management, browsing stationery products, placing orders, and viewing purchase history.

Supplier Module: Empowers stationery suppliers to manage product listings, orders, and communicate effectively with users through detailed information and streamlined order management.

Description: Manages stationery product listings and orders for suppliers.

Features: Adding, editing, removing products, providing detailed product information, search/filter options, order management, and communication with users.

2.4 Non-Functional Requirements

2.4.1 Hardware Specification

- Processor: Dual-core processor (e.g., Intel Core i3, AMD Ryzen 3)
- RAM: At least 2GB
- Storage: 128 GB Hard Disk or SSD
- Internet Connectivity: Stable broadband connection with at least 1 Mbps downloads speed

2.4.2 Software Specification

- Web Browser (Recommended): Google Chrome/ Mozilla Firefox/ Microsoft Edge/ Safari
- Operating System: The application is accessible on various operating systems, including Windows/ macOS/ Linux
- Security Software: Users can access the web application confidently, knowing that it's designed to be secure and safe, thus eliminating the need for additional antivirus or firewall software for browsing security

Chapter 3

DESIGN

3.1 ER Diagram

An Entity-Relationship (ER) diagram is a crucial component in database design, offering a conceptual blueprint that defines the data elements and relationships within a specific system. At its core, the ER model provides a high-level representation of how data is organized and connected. It serves as a fundamental tool for database designers to conceptualize and plan the structure of a database before implementation.

In essence, an ER diagram visually depicts the entities (such as objects, concepts, or individuals) within the system and the relationships between these entities. Entities are represented as rectangles, while relationships are depicted as lines connecting these entities. Additionally, attributes associated with each entity are illustrated within the rectangles, providing further detail about the data elements.

The ER model facilitates a simplified and intuitive view of data, making it easier for designers to understand and communicate the database structure. By mapping out entities, relationships, and attributes, it helps to ensure that the database design accurately reflects the requirements of the system it supports.

One of the key strengths of the ER model lies in its ability to capture complex relationships between entities. These relationships can take various forms, such as one-to-one, one-to-many, or many-to-many, each of which is represented differently in the ER diagram. This flexibility allows designers to model real-world scenarios effectively, ensuring that the database can efficiently store and retrieve data as required by the system.

Overall, the ER diagram serves as a vital tool in the database design process, providing a clear and concise representation of the system's data structure. By leveraging the ER model, designers can develop a solid foundation for building databases that meet the needs of their intended applications.

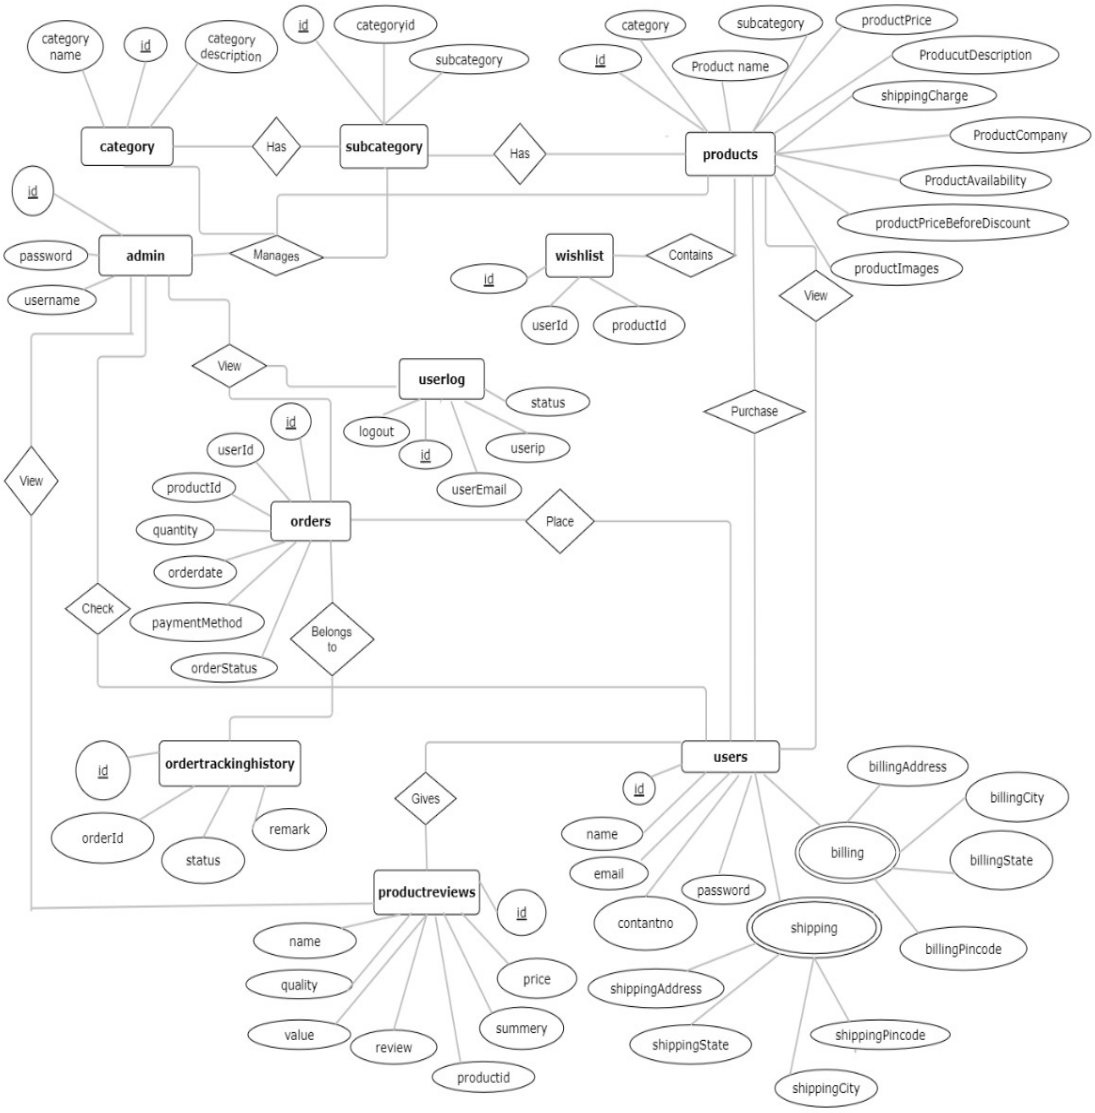

Figure 3.1: ER Diagram

3.2 Schema Diagram

A database schema serves as a blueprint outlining the logical structure of data storage within a database. It includes tables, representing data entities, with fields specifying attributes. Relationships between tables are established through primary and foreign keys, ensuring data integrity and coherence. Schema objects such as packages and views enhance data management and accessibility. Packages group related procedures and functions, while views offer simplified data representations. By defining the organization of data and relationships between components, a schema provides a structured framework for efficient data organization and retrieval, supporting the functionality and performance of the database system.

Figure 3.2: Schema Diagram

Chapter 4

IMPLEMENTATION

4.1 Implementation of table Creation

The Stationery Management System's database comprises tables for managing user and admin data, product listings, product reviews, user logs, wishlists, category and subcategory details, orders, and order tracking. User and admin information are stored separately, while product details, including images, categories, and subcategories, are managed within the Product table. Each product entry includes its associated image. Additionally, product reviews are recorded in a dedicated table, and user interactions, such as logging in and out, are tracked in the userlog table. Users can create wishlists, which are stored in a separate table. Orders placed by users are recorded in the Order table, along with order status, and the progress of each order is tracked in the ordertracking table. Various triggers, views, and procedures are implemented to optimize system functionality and streamline stationery management processes.

Table 4.1: Creation of User Table

Field	Type	Null	Key	Default	Extra
id	int(11)	NO	PRI	NULL	auto_increment
name	varchar(255)	YES		NULL	
email	varchar(255)	YES		NULL	
contactno	bigint(11)	YES		NULL	
password	varchar(255)	YES		NULL	
shippingAddress	longtext	YES		NULL	
shippingState	varchar(255)	YES		NULL	
shippingCity	varchar(255)	YES		NULL	
shippingPincode	int(11)	YES		NULL	
billingAddress	longtext	YES		NULL	

billingState	varchar(255)	YES		NULL	
billingCity	varchar(255)	YES		NULL	
billingPincode	int(11)	YES		NULL	
regDate	timestamp	NO		current_timestamp()	
updationDate	varchar(255)	YES		NULL	

Table 4.2: Creation of admin Table

Field	Type	Null	Key	Default	Extra
id	int(11)	NO	PRI	NULL	auto_increment
username	varchar(255)	NO		NULL	
password	varchar(255)	NO		NULL	
creationDate	Timestamp	NO		current_timestamp()	
updationDate	varchar(255)	NO		NULL	

Table 4.3: Creation of category Table

Field	Type	Null	Key	Default	Extra
id	int(11)	NO	PRI	NULL	auto_increment
categoryName	varchar(255)	YES		NULL	
categoryDescription	longtext	YES		NULL	
creationDate	timestamp	NO		current_timestamp()	
updationDate	varchar(255)	YES		NULL	

Table 4.4: Creation of Orders Table

Field	Type	Null	Key	Default	Extra
id	int(11)	NO	PRI	NULL	auto_increment
userId	int(11)	YES		NULL	
productId	varchar(255)	YES		NULL	
quantity	int(11)	YES		NULL	
orderDate	timestamp	NO		current_timestamp()	
paymentMethod	varchar(50)	YES		NULL	
orderStatus	varchar(55)	YES		NULL	

Table 4.5: Creation of ordertracking Table

Field	Type	Null	Key	Default	Extra
id	int(11)	NO	PRI	NULL	auto_increment
orderId	int(11)	YES		NULL	
status	varchar(255)	YES		NULL	
remark	mediumtext	YES		NULL	
postingDate	timestamp	NO		current_timestamp()	

Table 4.6: Creation of producteview Table

Field	Type	Null	Key	Default	Extra
id	int(11)	NO	PRI	NULL	auto_increment
productid	int(11)	YES		NULL	
quality	int(11)	YES		NULL	

price	int(11)	YES		NULL	
value	int(11)	YES		NULL	
name	varchar(255)	YES		NULL	
summary	varchar(255)	YES		NULL	
review	longtext	YES		NULL	
reviewDate	timestamp	NO		current_timestamp()	

Table 4.7: Creation of products Table

Field	Type	Null	Key	Default	Extra
Id	int(11)	NO	PRI	NULL	auto_increment
Category	int(11)	NO		NULL	
subcategory	int(11)	YES		NULL	
productName	varchar(255)	YES		NULL	
productCompany	varchar(255)	YES		NULL	
productPrice	int(11)	YES		NULL	
productPriceBeforeDiscount	int(11)	YES		NULL	
productDescription	longtext	YES		NULL	
productImage1	varchar(255)	YES			
productImage2	varchar(255)	YES			
productImage3	varchar(255)	YES			
shippingCharge	int(11)	YES			
productAvailability	varchar(255)	YES			

postingDate	timestamp	YES		current_time stamp()	
updationDate	varchar(255)	YES		NULL	

Table 4.8: Creation of subcategory Table

Field	Type	Null	Key	Default	Extra
id	int(11)	NO	PRI	NULL	auto_increment
categoryid	int(11)	YES		NULL	
subcategory	varchar(255)	YES		NULL	
creationDate	timestamp	YES		current_timestamp()	
updationDate	varchar(255)	YES		NULL	

Table 4.9: Creation of userlog Table

Field	Type	Null	Key	Default	Extra
id	int(11)	NO	PRI	NULL	auto_increment
userEmail	varchar(255)	YES		NULL	
userip	binary(16)	YES		NULL	
loginTime	timestamp	YES		current_timestamp()	
logout	varchar(255)	YES		NULL	
status	int(11)	YES		NULL	

Table 4.10: Creation of wishlist Table

Field	Type	Null	Key	Default	Extra

id	int(11)	NO	PRI	NULL	auto_increment
userId	int(11)	YES		NULL	
productId	int(11)	YES		NULL	
postingDate	timestamp	NO		current_timestamp()	

4.2 Implementation of Trigger:

These are special types of stored procedures in a database management system (DBMS) that automatically execute in response to certain events, such as insertions, updates, or deletions in a table. Triggers are useful for enforcing data integrity rules, auditing changes, or automating tasks.

Trigger in Our Project: The trigger you provided inserts a record into the logs_user table every time a new user is inserted into the users table.

```
Triggers `users`
--
DELIMITER $$
CREATE TRIGGER `trigger_1` AFTER INSERT ON `users` FOR EACH ROW INSERT
INTO logs_user values(null, NEW.id,"inserted",NOW())
$$
DELIMITER ;
```

4.3 Implementation of Procedure:

Also known as stored procedures, these are a set of SQL statements that are stored in the database and can be called by name. They allow you to encapsulate complex logic or frequently used tasks into a single unit, improving modularity, security, and performance of database operations.

Procedure In Our Project: The routine_1 procedure retrieves all records from the userlog table. Despite including an input parameter of type INT named routine_1, this parameter is not utilized within the procedure's body. Consequently, the procedure executes a simple SELECT * FROM userlog, returning all rows from the userlog table without any filtering or modification based on the input parameter.- Procedures

```
--
CREATE DEFINER=`root`@`localhost` PROCEDURE `routine_1` (IN `routine_1` INT)   se
lect * from userlog$$

DELIMITER ;
```

4.4 Implementation of Pages:

This section contains some codes that is used to implement the pages.

4.4.1 Implementation of Admin Login Page

The provided PHP script establishes a secure login mechanism for the admin panel of an online stationery store. It initializes sessions, suppresses error reporting, and imports configuration settings. Upon form submission, it retrieves and sanitizes user credentials, querying the database for authentication. Successful login redirects users to the password change page, while failed attempts trigger error messages and redirect back to the login page. The HTML content, styled with Bootstrap, includes a form for username and password entry, along with error message display. JavaScript libraries enhance client-side functionality. This robust script ensures controlled access for administrators, securing the store's administrative functionalities.

4.4.2 Creating a MySQL connection using the createConnection()

```
<?php
define('DB_SERVER','localhost');
define('DB_USER','root');
define('DB_PASS' ,'');
define('DB_NAME', 'shopping');
$con = mysqli_connect(DB_SERVER,DB_USER,DB_PASS,DB_NAME);
// Check connection
if (mysqli_connect_errno())
{
 echo "Failed to connect to MySQL: " . mysqli_connect_error();
}
?>
```

4.4.3 Entry point of the application

This PHP script serves as the backend logic for managing a shopping portal's homepage. It begins by starting a session and includes necessary configurations. The script handles adding products to the cart upon user interaction, updating quantities if the product is already in the cart, or adding it as a new item. It then alerts the user about the successful addition and redirects to the cart page. The HTML content defines the layout of the homepage, including sliders for

featured products, tabs for different product categories, and sections for various product types like files, table lamps, and pens. Each section dynamically fetches products from the database based on their category and displays relevant information such as name, price, availability, and an option to add them to the cart. Additionally, the script includes JavaScript and CSS files for styling and interactivity, ensuring a smooth user experience.

Chapter 6

CONCLUSION

Our online shopping website, developed using PHP, JavaScript, and XAMPP, is a testament to our dedication to creating an efficient e-commerce platform. Despite challenges in database design and security, collaborative efforts resulted in a fully functional website with user-friendly features. Looking forward, we aim to enhance the platform by integrating additional payment gateways and implementing personalized recommendations, all while prioritizing user experience and security.

Furthermore, our commitment to continuous improvement ensures that we remain responsive to the evolving needs of our online community. By incorporating analytics tools and refining our systems, we strive to optimize performance and user satisfaction. With these efforts, we are confident in providing a dynamic and engaging shopping experience that exceeds the expectations of our valued customers.
